oppi.li 1mo ago

- this seems to make entity subscriptions for each comment added. it should not make a new subscription if one already exists.

oppi.li 1mo ago

6ad59446

do we need `hasUnread` here? delibei's behavir on markRead is idempotent: if the notif is already read, it does nothing. calculating hasUnread costs us a network call anyway, and can potentially be wrong also because it does not work for >100 notifs.

Our bet on hackability

The era of personal software is here

Agents make building custom tools super cheap, and super easy to build.

Owning your infra

Self-hosting is as easy as it has ever been!

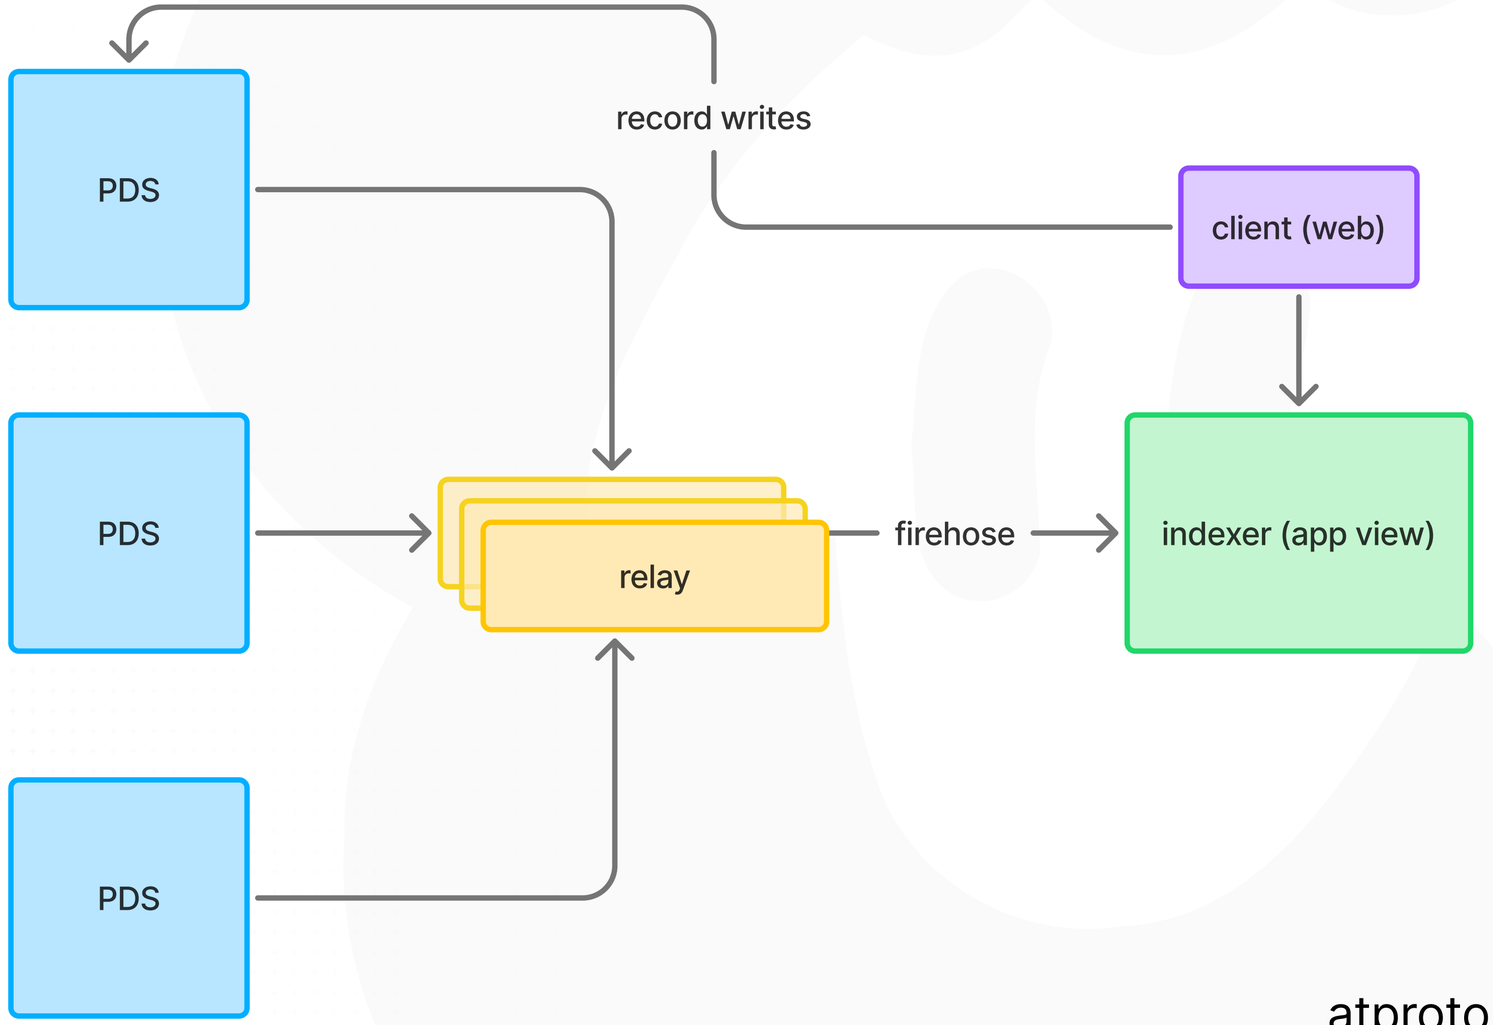

Our software must outlive us

Malleable software + open formats enable this.

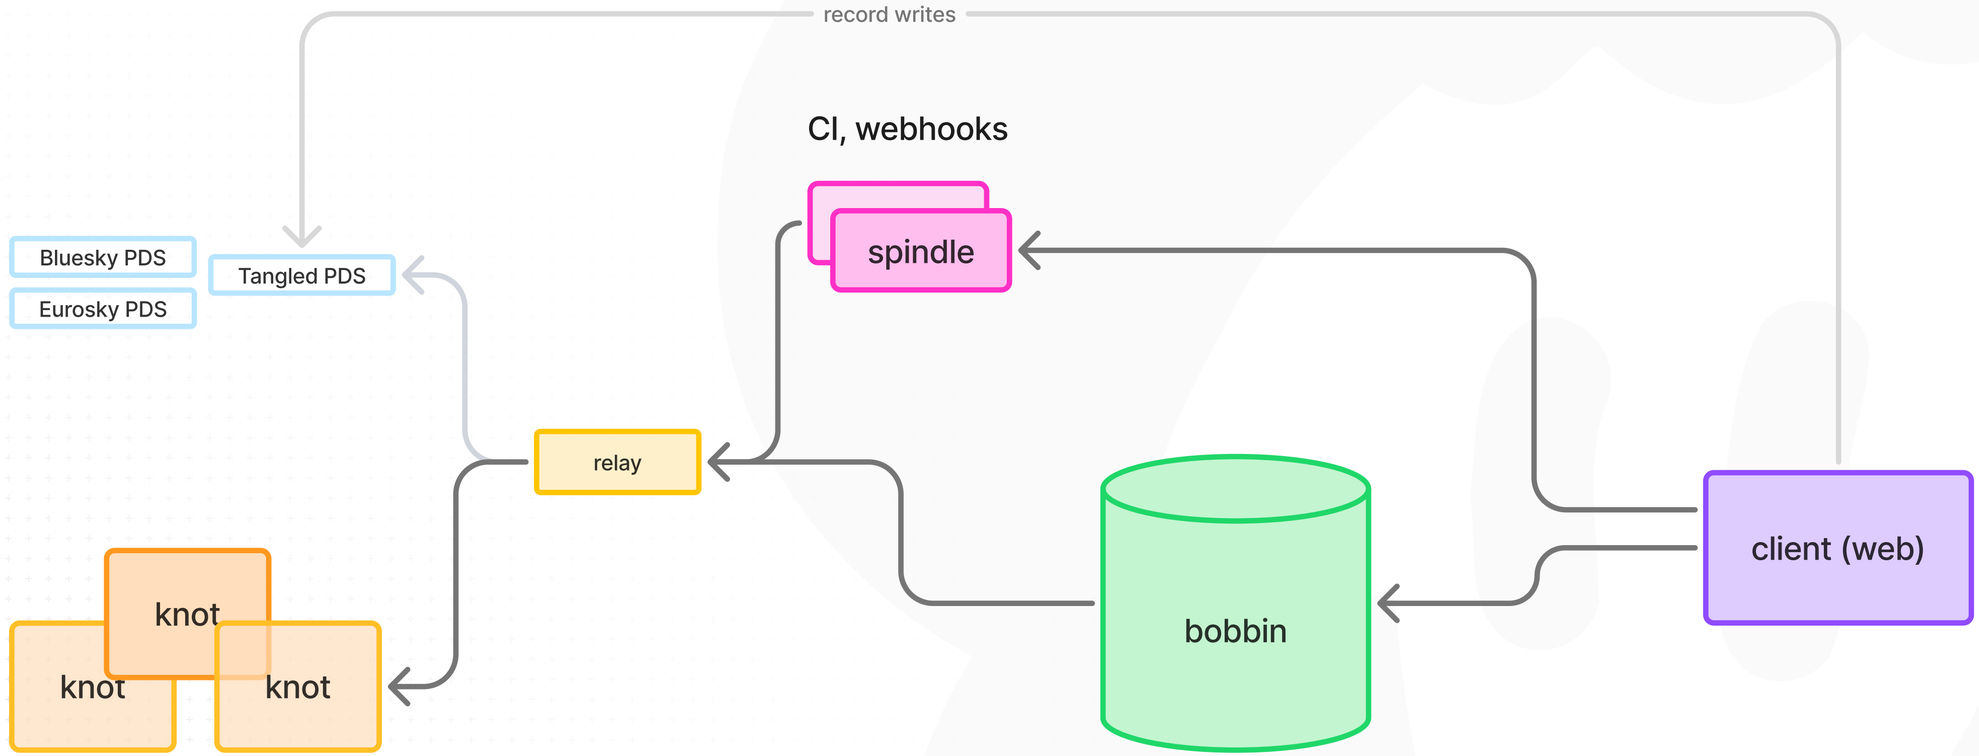

@ Protocol preface

1. accounts (did / @example.com)
2. signed, structured “records”

```
org.tangled.feed.star
org.tangled.actor.profile
org.tangled.*
```

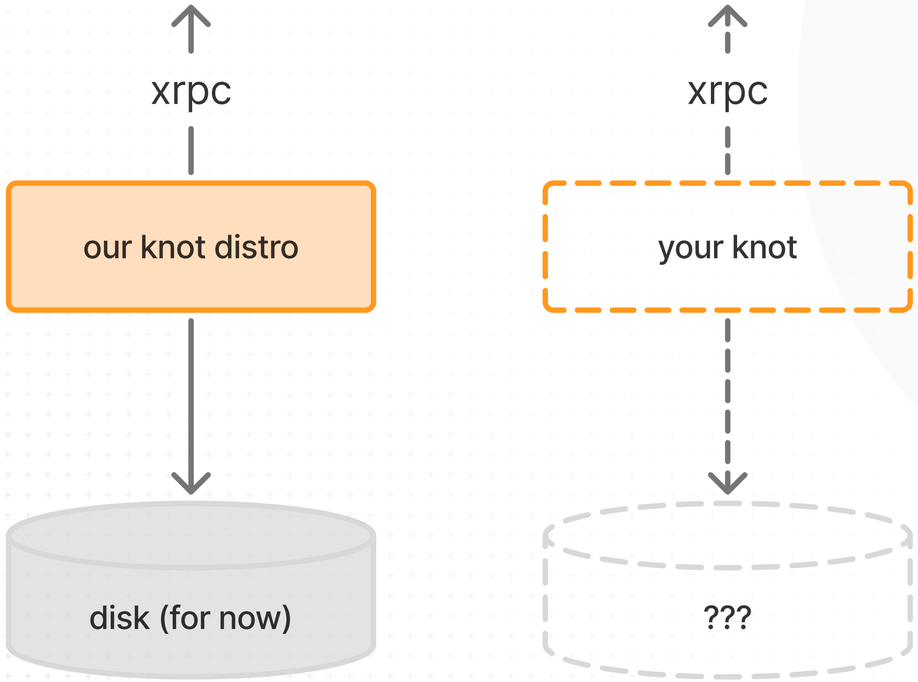

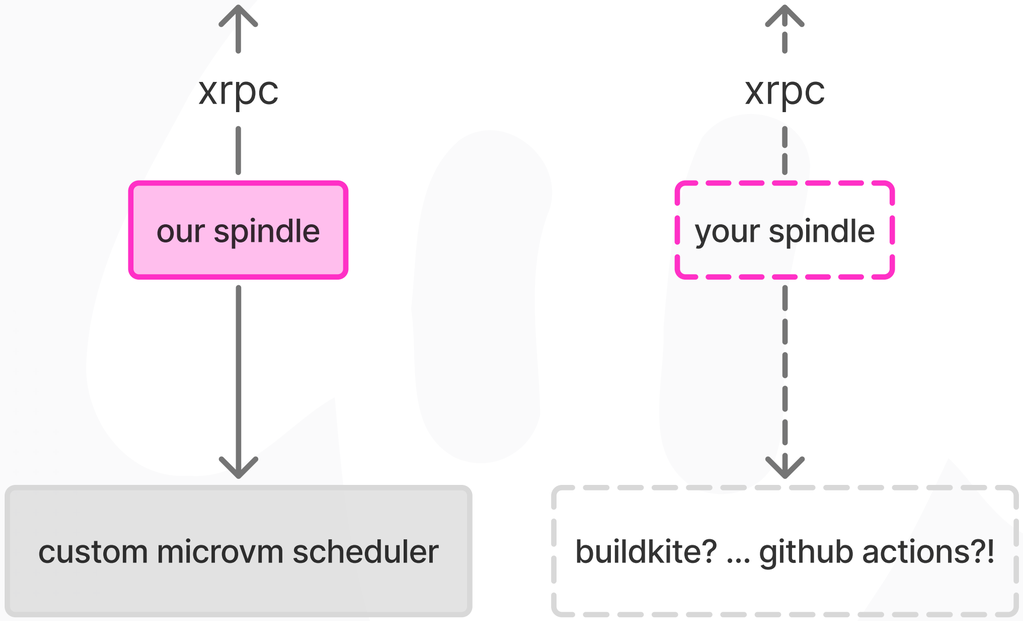

Architecture

- host git repos — this is your git remote
- store issues, pulls, collaborators, ACLs as COBs
- PDS-like

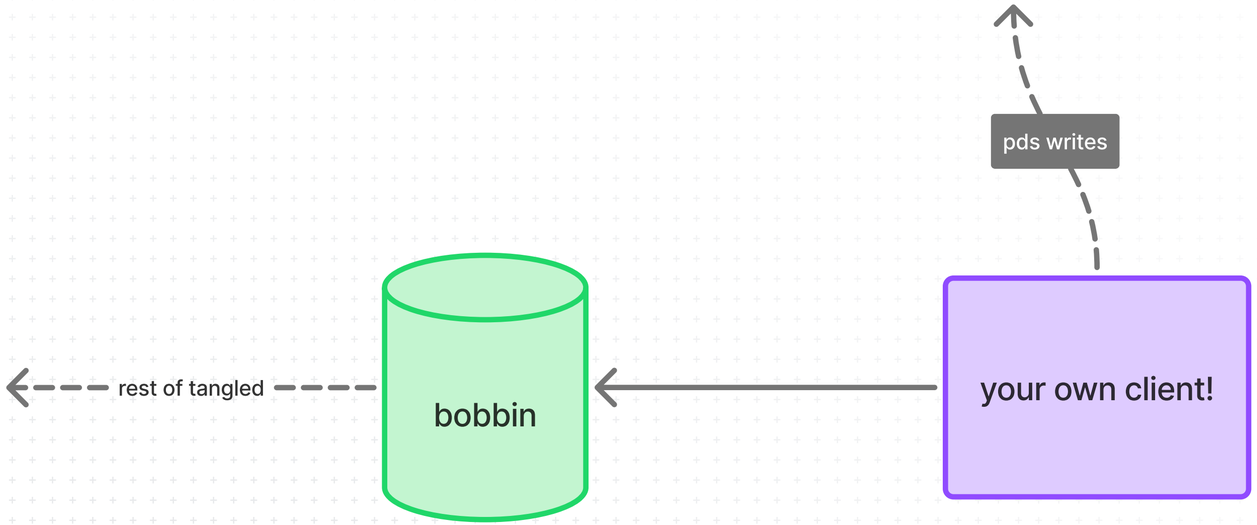

Interfaces

xrpc
our knot distro
disk (for now)
xrpc
your knot
???

xrpc
our spindle
custom microvm scheduler
xrpc
your spindle
buildkite? ... github actions?!

Going further

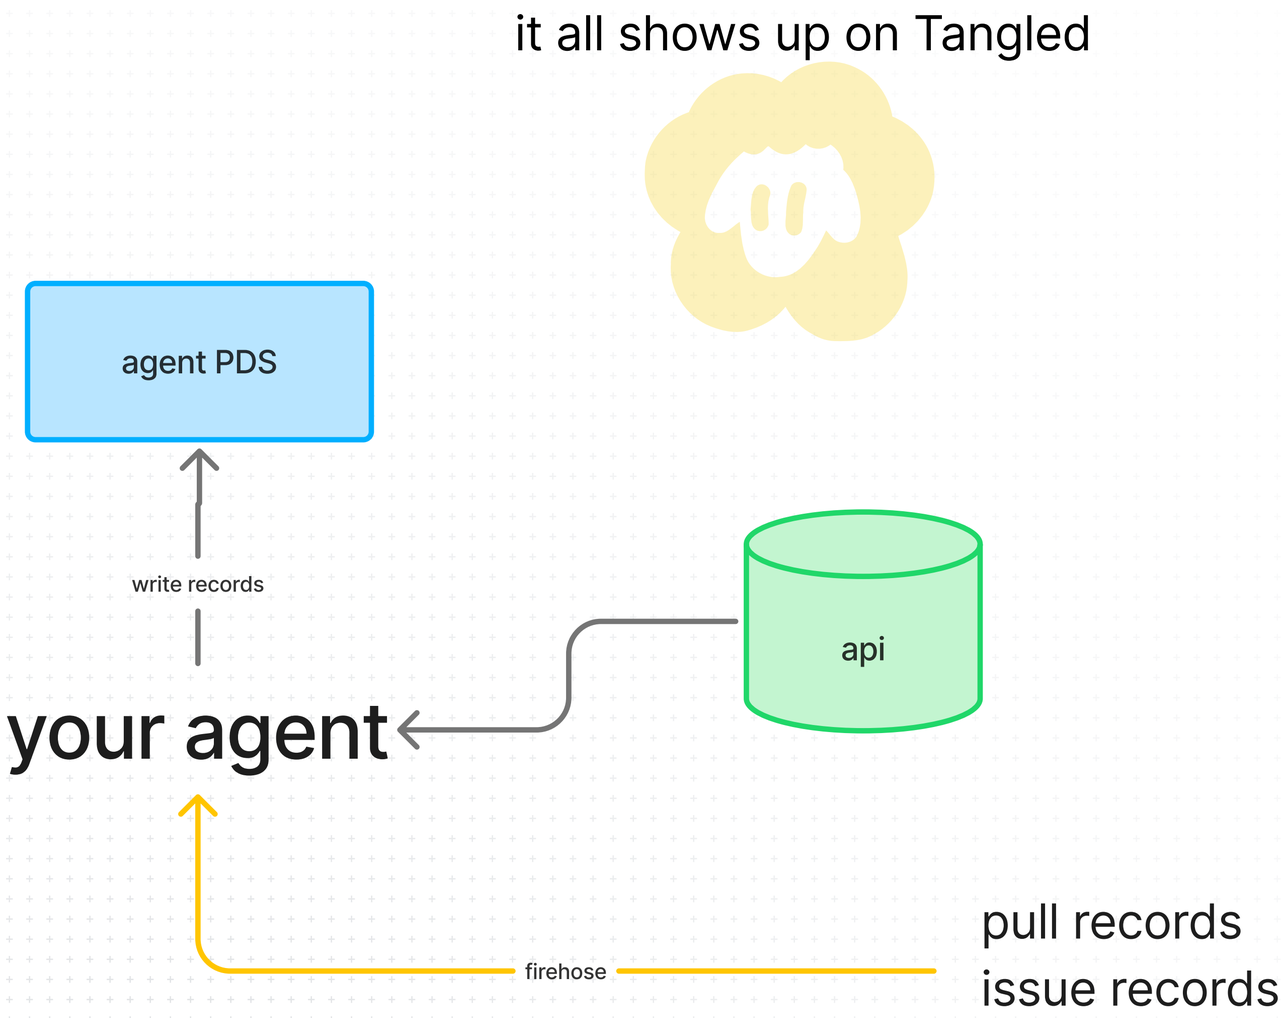

Build your own forge!

blog.tangled.org/bobbin

Going further

Custom agents!

✳ Conclusion

Malleable software wins

Building your own tools is cheap; you just need the interfaces.

Pick and choose

Run all of it, or parts of it, or none of it. Practical decentralization.

Built for humans and agents

Open protocols, formats and a scalable architecture.
